## Practice 23

## FOR USE WITH SECTION 4.4

Solve each equation. Round your answers to the nearest hundredth.

1. 
$$10^{2x} = 57$$

**2**. 
$$e^{4y/3} = 18$$

**3.** 
$$2 \cdot 10^{r-1} = 39$$

**4.** 
$$7e^{x/4} = 56$$

**5.** 
$$5^t = 26$$

**6.** 
$$4e^{n+2} + 3 = 45$$

7. 
$$3(0.8)^{2a} - 5 = 19$$

**8.** 
$$5 \cdot 3^x = 4 \cdot 2^x$$

Evaluate each logarithm. Round your answer to the nearest hundredth.

**12**. 
$$\log_{14} 87$$

**14.** 
$$\log_5 \frac{3}{4}$$

**16**. 
$$\log_{1.5} 6.3$$

Solve each equation. Be sure to check your solutions. Round decimal answers to the nearest hundredth.

**17**. 
$$\log_2 x = -4$$

**18.** 5 
$$\ln \frac{3x}{4} = 2$$

**19.** 
$$\log_3 (1 - 8v) = 2$$

**20.** 
$$4 \log_7 (3w + 1) = 14$$

**21.** 
$$\log_5(a+3) - \log_5(a-1) = 1$$
 **22.**  $\log_2(y+1) = 3 + \log_2(y-6)$ 

**22.** 
$$\log_2(y+1) = 3 + \log_2(y-6)$$

**23.** 
$$\log_9 (4x + 1) - \log_9 (2x - 7) = \frac{1}{2}$$
 **24.**  $\log_3 (\log_5 x) = 1$ 

**24**. 
$$\log_3(\log_5 x) = 1$$

25. A mortgage is a kind of loan that is usually repaid in equal monthly installments. The following formula gives the monthly payment M in terms of the amount of the loan P, the number of months n before the loan is fully repaid, and the monthly interest rate *r*:

$$M = \frac{rP}{1 - (1+r)^{-n}}$$

- a. Ariella borrows \$150,000 at 8.5% annual interest for 25 years, or 300 months. Calculate her monthly payment.
- b. Suppose Ariella would like to have \$1150 as a monthly payment. With the same interest rate as in part (a), how many months would it be before the loan was repaid?
