

It's Just a Lunar Phase

Student Activity

Name _____
Class _____

Open the TI-Nspire document *Its_Just_a_Lunar_Phase.tns*.

Astronomical observations and measurements have played a big part in the development of both science and mathematics. In this activity, you will examine images of the Moon to estimate, graph, and analyze its **illumination**. You will then use an animation of the Moon's orbit to investigate the cause of lunar phases.

Move to page 1.2.

Press **ctrl** **▶** and **ctrl** **◀** to navigate through the lesson.

1. Read the background on page 1.2. Then examine the images on the handout titled "The Lunar Cycle." For each day, estimate and record the percentage of the Moon that is illuminated, or visible, then write your percentages as decimals filling in the missing data as shown in the following table.

Day	Illumination		Day	Illumination		Day	Illumination		Day	Illumination	
1	1%	0.01	8			15			22	39%	0.39
2			9	72%	0.72	16	95%	0.95	23		
3			10			17			24	24%	0.24
4	19%	0.19	11	89%	0.89	18	82%	0.82	25		
5			12			19			26		
6	39%	0.39	13	98%	0.98	20	62%	0.62	27	5%	0.05
7			14			21			28		

Move to page 1.3.

2. Enter your illumination data (as decimals) into the spreadsheet.

Q1. What general patterns do you see in the table or spreadsheet?

It's Just a Lunar Phase

Student Activity

Name _____
Class _____

Move to page 1.4.

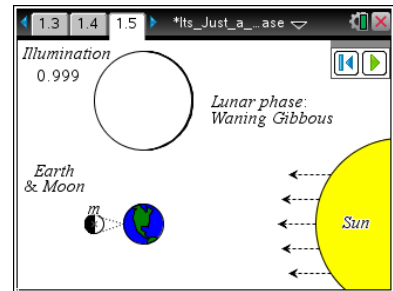

3. The data in your spreadsheet is plotted on the graph. The day is the independent variable, or a variable that isn't changed by another, and *illumination* is the dependent variable, a variable that does change based on another.

Q2 How does the graph change your ability to spot a pattern?

Move to page 1.5.

4. Page 1.5 shows the illuminated portion of the Moon, along with its position relative to Earth and the Sun. Change the Moon's position by dragging point *m*, which is shown as an "x" in the center. You can also click the play button to move the Moon around the Earth. Observe the position of the Moon, the Sun, and Earth at different **phases**. Click to stop the Moon at any point, and click to reset the Moon to its original location.

Q3. How does the Moon's location around Earth affect its phase?

Move to page 1.6.

5. Page 1.6 contains a graph of an actual lunar cycle. When taking a measurement, there may be a difference between a measured value and an actual or accepted value. **Percent error** is a measure of how close the values are. It is calculated using the following equation:

$$\text{percent error} = \frac{|\text{estimated value} - \text{actual value}|}{\text{actual value}} \times 100$$

Since only estimates were used in Step 1, the measured value will be called the estimated value.

It's Just a Lunar Phase

Class _____

- Q4. Choose a day, (not a given one), from the table completed in Step 1, on page 1.3 of the tns file, and record your estimated illumination below. On the graph, click on the Day value (x-value) inside the ordered pair and re-type the whole number day you have chosen. Record the y-value, or the second value in the ordered pair, of the point as the actual illumination. Use the Scratchpad  to calculate percent error.

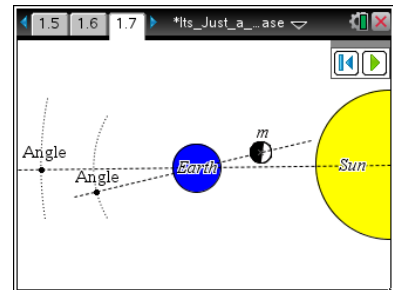

Day: _____ Estimated illumination: _____ Actual illumination: _____

$$\text{Percent error} = \frac{\boxed{} - \boxed{}}{\boxed{}} \times 100 = \underline{\hspace{2cm}}$$

Move to page 1.7.

6. A common question is, "Why doesn't every new moon and full moon result in an **eclipse**?"

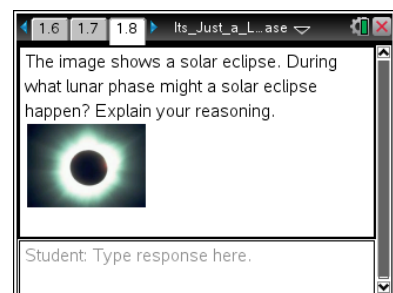

Page 1.7 shows the orbital angles of the Moon and Earth. To change these angles, drag the points labeled "Angle." Change the Moon's position by dragging point *m* or using the animation buttons.

- Q5. What are the requirements of the orbital angles of the Moon and Earth for an eclipse to happen?

Move to page 1.8. Answer question 6 here and/or in the .tns file.

7. The lunar phase determines whether a solar eclipse or a lunar eclipse might happen.

- Q6. The image shows a solar eclipse. During what lunar phase might a solar eclipse happen? Explain your reasoning.
